## The Media Player Web Part for SharePoint 2007

The Media Player Web Part for SharePoint 2007 is created to play media files in SharePoint web portals. The Media Player Web Part displays the media content and provides the standard playback controls that are expected from a web-based video player.

Media content can be sourced from a Document Library. The video web part player can be connected directly to a list of a Document Library of media files. The Media Player Web Part can be easily deployed under SharePoint 2007.
